

ABSTRACT

Tube for conveying fluids comprising a plurality of concentric layers (2), an inner layer (3) constituting a conduit (3a) for a fluid to be conveyed, and at least an outer layer (5) for protection and reinforcement mounted externally to the inner layer (3), in which the inner layer (3) is pigmented and mainly made of a fluoridated polymer chosen between MFA and PFA. The tube (1) further comprises at least an adhesive (6) interposed between the outer layer (5) and the inner layer (3).

The present invention also relates to a method for the production of said tube (1), comprising the following steps: subjecting an outer surface (4) of the inner layer (3) to a cementing process, subsequently applying an adhesive (6) to the outer surface (4), and coating the outer surface (4) with at least an outer layer (5). The cementing process takes place by at least partial defluorisation of the outer surface (4) of the inner layer (3).
